

Heston moyers website information

So, I think for this website I need to have a lot of detailed instructions of what the furniture is made of. The most recent project that I did was the kitchen table for my wife. The table is made of solid pine. We were also able to make it the exact color we were wanting. The top of the table is stained and the legs are painted white. You need to Be sure wood is dry. Material from a job site or floor joists that existed in a crawlspace may have high moisture content; material from a conditioned space should be dry. Wood can be dried in a kiln or stored inside through the winter. If you don't have time to wait the winter for it to dry stack wood in a hot dry place with 1" spacers between layers. Allow to dry for at least two weeks.

Rough-cut boards to the desired length, plus 2 inches. A final cut will be done after the planks are joined.

If planks are slightly cupped or twisted, have them planed at a local millwork shop or borrow a tabletop planer and tackle the job yourself. If planning yourself, first check planks for and remove nails and excess dirt*. Run planks though the planer, stripping a small amount of wood from each side as you plane. While the board is going through the planer, manually adjust the depth of the cut to compensate for irregular thickness (or twist) over the board's length. You can hurt yourself or damage the board or planer if you do not manually adjust as you go. Keep running boards through the planer until the blade has lightly stripped each surface. Next, rip boards on a table saw to create straight edges; planks do not have to be identical in width. I do my best to get all my materials from a reputable lumber yard and all the wood is pre-dried so I can begin building your furniture today.

I can build any furniture that you can think of. Anything from a bed that is lined with fabric to a solid wood book shelf. I have built coffee tables benches book shelves entertainment centers kitchen tables and much more. I have been building furniture with my dad since I was in the 8th grade and it just comes naturally to me. All the furniture that I build is reinforced with screws not nails. Although nails are faster screws give it the durability that I guarantee.

All my furniture can be custom altered. If you want a different piece somewhere else or you want it taller or shorter I can do that. The sky is the limit for my furniture. Depending on the size of the furniture will determine the time it takes to build but I body guarantee furniture to be done no more that 3 weeks from the date of order
